

For Immediate Release:

COMPTOLIFE Comes to Life

Technologies and Kits for adapting common tablet and laptop computers to enable each to be used as an automated external defibrillator (AED) to treat victims of sudden cardiac arrest.

Boca Raton, FL, November 2, 2015 -- **COMPTOLIFE™** (COMPTOLIFE.com) is a start-up Medical Device Company having evolved from **BABRICLifeScienceInnovations™**. Focused on developing its critically needed advanced defibrillator technologies, the Company has announced that it has been issued multiple additional Patents detailing technologies for adapting the common tablet and laptop computer to enable each to be used as an automated external defibrillator (AED), and/or as a manual defibrillator for treating victims of Sudden Cardiac Arrest (SCA).

Key in the process of resuscitation is the immediate initiation of quality cardiopulmonary resuscitation (CPR) and the early use of automated external defibrillators (AEDs) by bystanders pending arrival of professional rescuers.

Typically, when sudden cardiac arrest occurs, death can result within minutes if the victim receives no treatment. Brain damage can begin to occur in just 4 to 6 minutes after the heart stops pumping blood. A victim's chance of survival is reduced by 7 to 10 percent with every minute of delay until defibrillation.

A recent **Report** by the **IOM (Institute of Medicine)** "**Strategies To Improve Cardiac Arrest Survival -- A Time to Act**" (June 30, 2015) ... states that every year in the U.S. about 395,000 cases of cardiac arrest occur outside hospitals, and less than 6 percent of these victims survive.

According to the **American Heart Association**, early CPR and rapid defibrillation combined with early advanced care can produce high long-term survival rates. When bystanders provide immediate CPR, and the first shock is delivered within 3 to 5 minutes, the reported survival rates from sudden cardiac arrest are as high as 48 to 74 percent.

Barry H. Schwibner, M.D., a Co-Founder of **COMPTOLIFE** states, "a previously issued **COMPTOLIFE** Patent details a Kit with AED elements contained in an adjustable universal frame for encompassing and holding a tablet or laptop computer. The AED elements are connected to and controlled by the joined computer, thus retrofitting and enabling the tablet or laptop to be used as an AED."

Dr. Schwibner continues, “the recently issued Patents cover technologies that detail both the direct embedding of AED and manual defibrillator capabilities into tablet and laptop computers at the time of manufacture, and also detail an additional Pocket Kit for the retrofitting of existing tablet and laptop computers as AEDs and/or manual defibrillators.”

“The current less than 6 percent survival rate quoted in the recent **Institute of Medicine Report**”, Schwibner notes, “indeed reinforces the need for additional technologies to expand the status quo. **COMPTOLIFE’s** Technologies and Kits represent an ideal approach for creating the universal availability and ready access to defibrillators by both medical professionals and the general public— devices also capable of providing widespread training of the public and fulfilling an urgent need as an addition and complement to the current state of the art... *Public Access Defibrillation* — which we believe will result in a major positive impact on Sudden Cardiac Arrest (SCA) survival. **COMPTOLIFE** is poised to solve the issue of not having a defibrillator when it is needed.”

Dr. Schwibner comments, “**COMPTOLIFE** is currently working towards applying its Technologies to rugged tablets and laptops used in the field; such as by first responders, the military, and in government, sports, and industry. Additionally, with the manual defibrillator option, we are also moving towards applying these Technologies to Medical Tablets or Mobile Clinical Assistants (MCAs); rapidly increasing in use by physicians, nurses and other medical support staff with the current trend toward electronic health records (EHRs).”
